

## Government Agencies

The government spends billions of dollars annually to fund construction projects, with additional funding coming from state and local governments who operate capital improvement funds. As someone likely is involved with the implementation of these capital improvement projects, you may be facing one of more of the following issues:

- The need to capture and securely store data associated with your capital project, from design through operation and maintenance
- The challenge of data silos within your organization (ex: lack of integration between GIS and engineering applications, which can lead to costly change orders and backlogs of “as-builts”
- The need to be as cost effective and transparent as possible
- The importance of delivering projects on time while protecting the health and safety of workers

Governments have long turned to Autodesk for help addressing these issues. Autodesk software provides customers with a single platform that allows for the capture, storage, and ongoing use of project data and files.

Bruce has spent the past 15+ years helping governments better manage projects using Autodesk. He has the relationships, experience, and tools needed to successfully support you in managing and delivering successful projects.

“ One thing I've learned since then is that when you are working with Bruce, it isn't a marketing pitch. But 'genuine' is only part of what Bruce brought to our work together. He asks the right questions, listens and truly tries to understand our perspectives and concerns, advocates for our interests, offers excellent advice and strategic thinking.
